

README File for the replication “The Allocation of Incentives in Multi-Layered Organizations: Evidence from a Community Health Program in Sierra Leone”

Overview

The code in this replication package constructs the analysis file from 2 data sources using Stata. Two main files run all of the code to generate the data for the 4 figures and 19 tables in the paper.

The code was last run on an Apple M1-based Macbook Air with MacOS version 14.5. The replicator should expect the code to run for about 10 hours (FYI, Figure A.5 takes a long time to run).

Details on each Data Source

Data.Name	Data.Files	Location	Provided	Citation
Survey data	data_supervisors.dta data_workers.dta data_households.dta	Data/	TRUE	

Computational requirements

Software Requirements

- Stata (code was last run with version 18)
 - outreg2
 - coefplot
 - rwolf2
- These packages are necessary to run the main analysis file (Analysis_Replication.do) and all dependencies will be installed locally in the preamble of this file.
- Matlab (code was last run with Matlab_R2023b Update 7)
- Mathematica (code was last run with Mathematica 13.0.1.0)

Controlled Randomness

Random seed is in program [Analysis_Replication.do](#) in the following lines:

- 129
- 130

Instructions to Replicators

- Edit Do-files/Merge_and_Clean.do to adjust the default path.

- Run Do-files/Merge_and_Clean.do once to clean the field data and merge it to create the dataset for analysis.
- Edit Do-files/Analysis_Replication.do to adjust the default path.
- Run Do-files/Analysis_Replication.do once to replicate the results in the empirical section and produce the tables and figures present in the manuscript. Output files are called appropriate names (Visits.xls, graph_coef_reports_overtime.png) and should be easy to correlate with the manuscript.

The programs were last run top to bottom on September 18th, 2024.

Instructions to Replicators of Structural Analysis

- Run Do-files/Structural_Estimation.m using Matlab.
- Open Do-files/Structural_Output.do using Stata. Adjust the path name on the second line of the code.
- Run Do-files/Structural_Output.do. This file produces all Tables that report the results of the structural analysis.
- Open Do-files/Counterfactuals.ng using Mathematica. Adjust the path name on the first line of the code.
- Run Do-files/Counterfactuals.ng. This file produces all Figures that report the results of the structural analysis, and also some Figures that show key cases of the model.

Note that Structural_Estimation.m relies on moments and parameters that can be replicated running Do-files/auxiliary/Structural_Inputs.do.

These programs were last run top to bottom on October 17th, 2024.

Note also that we found some minor numerical differences (in terms of decimal points) when one replicates the structural output with a different computer (and the same version of matlab), despite the controlled randomness. These are due to minor differences in the workings of the numerical optimization algorithm.

List of tables and programs

Figure/ Table #	Program	Line Number	
Table 1	Analysis_Replication.do	210	Sum Stats.xls
Table 2	Analysis_Replication.do	316	Visits.xls
Table 3	Analysis_Replication.do	372	Health.xls
